

Campus Connect

...

End of Term Presentation

Implementing

Features:

- Account Profiles
- Student Search Function
- Direct Messages
- Message Boards

Status: In progress

The learning Curve

Understanding

- React-native
- Reactjs

Object Oriented

- Component interaction

This framework is very flexible => Complexity

- Navigation
- Input validation

React Native

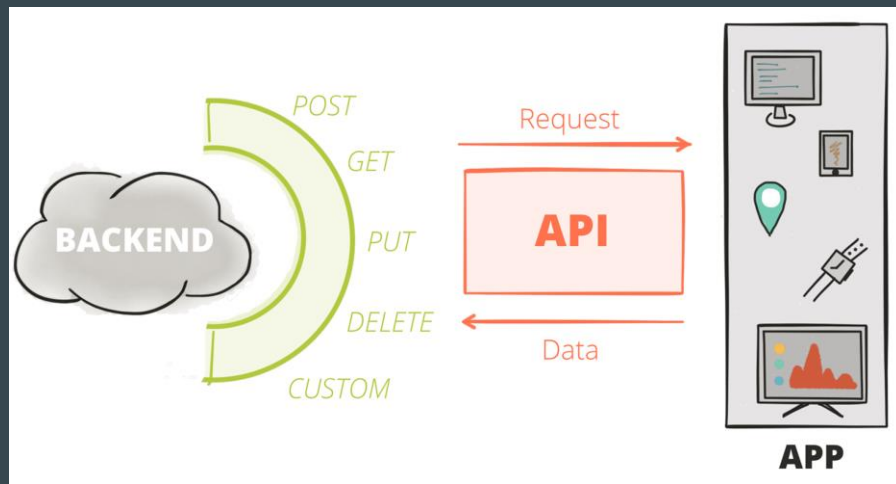

Mock Data Added

- Simple entries that followed constraints that were previously set up
- Used for testing of application

		ID	Email	FirstName	LastName	Department	AcademicYear
	 Edit  Copy  Delete	1001	christian@csub.edu	Christian	Durrell	Arts and Humanities (AH)	Junior
	 Edit  Copy  Delete	1002	aldric@csub.edu	Aldric	Coye	Business and Public Administration (BPA)	Freshman
	 Edit  Copy  Delete	1003	hillie@csub.edu	Hillie	Vurley	Arts and Humanities (AH)	Junior
	 Edit  Copy  Delete	1004	dalt@csub.edu	Dalt	Van der Kruis	Natural Sciences Mathematics and Engineering (NSME...)	Freshman
	 Edit  Copy  Delete	1005	rik@csub.edu	Rik	Seville	Business and Public Administration (BPA)	Sophomore

What is an API?

- An API (application programming interface) is a very useful tool for mobile and web apps.
- Acts as an interface between the user applications and the data that the user sees
- Can be thought of as a virtual middle man

API Creation

- Exists on our digital ocean server
- Implemented in PHP
- For now, simple functions are present that will become more complicated as the project progresses
- Returned in a format that is easy to handle for the React Native framework

```
<?php
define("HOST", "localhost");
define("USERNAME", "root");
define("PASSWORD", "c4m9p1s0");
define("DATABASE", "CampusConnect");
$link = mysqli_connect(HOST, USERNAME, PASSWORD, DATABASE);
if (!$link) {
    echo('no connect');
    die('Could not connect: ' . mysql_error());
}
?>
```

```
<?php
require_once('connect.php');
$fetch = mysqli_query($link, "SELECT * FROM Users");
$return_arr = array();
while ($row = mysqli_fetch_assoc($fetch)) {
    $return_arr["users"][] = $row;
}
echo json_encode($return_arr);
?>
```

Testing the API

- Postman is a very useful application to test endpoints
- Shows how the data is returned to help with formatting

```
1 {
2   "users": [
3     {
4       "ID": "1001",
5       "Email": "christian@csb.edu",
6       "FirstName": "Christian",
7       "LastName": "Durrell",
8       "Department": "Arts and Humanities (AH)",
9       "AcademicYear": "Junior"
10    },
11    {
12      "ID": "1002",
13      "Email": "aldric@csb.edu",
14      "FirstName": "Aldric",
15      "LastName": "Coye",
16      "Department": "Business and Public Administration (BPA)",
17      "AcademicYear": "Freshman"
18    },
19    {
20      "ID": "1003",
```

Login/Signup and Fetching User Data

Profile and Account setting

Goals Since Last Presentation

- Fix React-Native errors causing members to be unable to run project (Complete)
- Create login and signup screens (In progress)
- Fetch and display user data from database (Complete)
- Insert input data into database (In progress)

Future Goals

- Insert data from app into database
- Design app to look nicer
- Messaging feature
- Message board feature
